## Extended Gravitation Practice-Pre-AP

Mass of Earth $5.98 \times 10^{24} \mathrm{~kg}$
Mass of Moon $7.35 \times 10^{22} \mathrm{~kg}$
Mass of Sun $\quad 1.99 \times 10^{30} \mathrm{~kg}$ $\mathbf{g}$ (Earth) $\quad 9.80 \mathrm{~m} / \mathrm{s}^{2}$

Radius of Earth 6,378,000 m
Radius of Moon 1,738,000 m Radius of Sun $6.96 \times 10^{8} \mathrm{~m}$ Radius of Mars 3,398,000 m

Name:

Earth/Sun dist. $150,000,000,000 \mathrm{~m}$
Earth/Moon dist. $384,000,000 \mathrm{~m}$
G $\quad 6.67 \times 10^{-11} \mathrm{~N}^{*} \mathrm{~m}^{2} / \mathrm{kg}^{2}$
g (Mars) $3.7 \mathrm{~m} / \mathrm{s}^{2}$

1. Using two different methods, calculate the weight of a 25 kg object on Earth.
2. Using the acceleration of gravity on Mars, calculate the mass of the planet Mars.
3. The average distance between the Moon and the Earth is $3.84 \times 10^{5} \mathrm{~km}$. Find the net gravitational force the Earth and the Moon exert on a $3.00 \times 10^{4} \mathrm{~kg}$ spaceship located halfway between them.

## Ans:

4. Find the point between the Earth and the Sun at which an object can be placed so that the net gravitational force exerted on it by these two objects is zero.
5. A coordinate system (in meters) is constructed on the surface of a table and three masses are placed on the coordinate system as follows: a 2.0 kg mass at the origin, a 3.0 kg mass at $(0,2.0)$, and a 4.0 kg mass at $(4.0,0)$. Find the resultant gravitational force exerted on the mass at the origin.

Ans:
6. Practice deriving Newton's Form of Kepler's $3^{\text {rd }}$ Law:
7. Io, one of the four Galilean moons of Jupiter, has an orbital period of 1.77 days and an orbital radius equal to $4.22 \times 10^{5} \mathrm{~km}$. From this data, determine the mass of Jupiter.
8. Geosynchronous satellites have an angular velocity that matches the rotation of the Earth and follow circular orbits in the equatorial plane of the Earth. (Almost all communication satellites are geosynchronous and appear to be stationary above a point on the Earth's equator.) What is the radius of a geosynchronous satellite? How high (in miles) is this above the Earth's surface?

Ans:

Ans:
