

# Momentum Unit Test

Name: \_\_\_\_\_

**Multiple Choice.** Select the best response to each question below.

- Momentum is an important quantity in physics because it tells you about an object's
  - Mass
  - Direction of motion
  - Speed
  - All of the above
- Which has the greatest momentum?
  - A skateboard ( $m = 10.0$  kg) slowly rolling up a hill.
  - A semi-truck ( $m = 9000$  kg) parked at Hardee's.
  - A Honda Civic ( $m = 1000$  kg) cruising down I-65.
  - They all have the same momentum.
- A pitcher throws a baseball towards a batter at a speed of  $+35.0$  m/s. Which of the following situations represents the highest impulse applied to the ball?
  - The catcher bringing the ball to a clean, dead stop.
  - The batter bunting the ball back toward the pitcher at  $-5.0$  m/s.
  - The batter hitting a line drive over the pitcher at  $-50.0$  m/s.
  - The all have the same impulse.
- How much force is necessary to bring a  $0.50$  kg ball moving at  $10.0$  m/s to a stop in  $0.20$  seconds?
  - 25 N
  - 10.7 N
  - 1.0 N
  - 0.010 N
- Automotive engineers need to design a car that minimizes the force on the car during a collision. Which of the following ideas would be most successful?
  - Increasing the amount of time of the collision by making bumpers that compress and crumple
  - Strengthening the bumpers of the car so that the car will bounce in the opposite direction in a crash
  - Adding weights to the rear of the car to increase the car's inertia
  - Using 22-inch tires instead of 18-inch tires
- During the Great Snow Storm of 2015, your car is stuck in the snow. You sit inside your car and push against the dashboard with a force of  $+150$  N. Which of the following is true?
  - The total momentum of the car (with you inside) is conserved.
  - The dashboard pushes on your hand with a force of  $-150$  N.
  - There are no external forces so the car (with you inside) does not accelerate.
  - All of the above.
- A  $38$  kg kid sitting motionless on a playground swing catches a  $2$  kg ball moving horizontally at  $5$  m/sec. How fast will the combination kid-and-ball move just after the catch?
  - $0.25$  m/s
  - $0.50$  m/s
  - $1.0$  m/s
  - $2.0$  m/s
- Consider a soccer ball sliding on a frozen lake (frictionless) towards a stationary basketball. For which system is momentum conserved before and after the collision?
  - Soccer Ball System
  - Basketball System
  - Soccer Ball—Basketball System
  - Momentum is conserved for any system

**Puzzles** (Show all calculations and equations..)

9. A car with mass 1500 kg moves at 25 m/s. Use the impulse-momentum theorem to determine the final speed of the car if a braking force of 2900 N is applied for 11 s in order to decrease its speed.

10. A 150 g dart moving horizontally at 14 m/s strikes and sticks to a stationary wood block of mass 8850 g, which then slides across a friction-free level surface. What is the speed of the block and dart after the collision?

11. Physics often "takes a back seat" in comic books like Superman. But let's take physics into account in the following situation: Imagine Superman ( $m = 125 \text{ kg}$ ) is simply holding an asteroid ( $m = 125,000 \text{ kg}$ ) in outer space. In the comic, Superman throws the asteroid forward at  $1.00 \times 10^2 \text{ m/s}$  and is at rest afterward...but what does physics say Superman's recoil speed *should* be?

12. Two green Vernier low-friction dynamics carts are on a black track. One cart of mass 1.03 kg is at rest in the middle of the track. A second cart of mass 0.515 kg is moving at +2.00 m/s and collides elastically with the other cart. The after collision velocity of the 1.03 kg cart is +1.33 m/s. Find the after collision velocity of the 0.515 kg cart.
